

TMS for Probable Alzheimer's:

Studying Memory and Cognitive Functions in Suspected Alzheimer's

Study Investigators:

Michael Leuchter, MD, MSc
& Nanthia Suthana, PhD

ABOUT

The purpose of this study is to examine whether Transcranial Magnetic Stimulation (TMS), a gentle non-invasive brain stimulation method, affects changes in memory and other cognitive functions in those with suspected Alzheimer's.

Parking will be covered for all visits.

Participants will receive either active or sham TMS. Those who receive sham may be eligible to also receive active treatment after the completion of the study.

You may be eligible if you:

- Are an English speaker
- Have an Alzheimer's Diagnosis or Probable Alzheimer's Diagnosis
- Are between 60-100 years of age
